

Random Walk

- Density is squared for two dimensions, cube root for three dimensions, etc.
- Every turtle has a dx and dy coordinate that tells where a turtle will be if were to move
- For the random walk model, think about reporting the mean value, standard deviation, variance, etc.
- --Does the Levy walk really help to produce the pattern?--
- Show the trajectories between the correlated random walk and the Levy walk
 - The difference might be in the number of agents
- Look into a setting where the pattern doesn't emerge, and see if the metric gives a difference
 - Standard deviation was randomly chosen, so another metric can be used
 - Look at difference between space empty and space covered
