

Algorithms HW 1

1.17.12

Brandon Buchanan

- Algorithm to find whether or not an n -bit number is prime.

Al. Loop through 2 sets of numbers, multiplying each and comparing the answer with the n -bit number to test if they are equal. The set of numbers does not include one and is at most $n/2 - 1$ large. If even one outcome is equal, the n -bit number is not prime.

The algorithm is exponential in terms of big O.
